

CREATYV / Mint More

Design Intelligence Report

Static product audit for strategy, UX, information architecture, and implementation readiness

Generated: July 2026

Scope: Frontend, backend, routes, services, database/migrations, roles, feature flags, workflows, README and project documentation available in the local codebase.

Method: Evidence-first static audit. Conclusions are classified as VERIFIED, INFERRED, UNKNOWN, or CONTRADICTION.

Evidence Classification Key

Field	Observed Product Intelligence
VERIFIED	The codebase or documentation explicitly proves this.
INFERRED	Likely based on multiple code paths, naming, or workflow connections, but not explicitly documented.
UNKNOWN	There is not enough reliable information in the project to know.
CONTRADICTION	Different parts of the project disagree or represent different product eras.

1. Executive Summary

VERIFIED: The product currently behaves as a managed creative operations platform named CREATYV / Mint More, with client-facing modules for calendar creatives, custom requests, Mintbox storage, insights, messages, support, settings, and Mint AI.

VERIFIED: The same codebase also contains older or future marketplace functionality: freelancer onboarding, matching, negotiation, wallet, escrow, subscriptions, commissions, and marketplace browsing.

INFERRED: The immediate launch shape is Phase 1 internal fulfillment: clients request creative work and Mint More staff/designers execute it, while freelancer marketplace features remain hidden behind feature flags.

INFERRED: Current maturity is a pilot-stage multi-module MVP: many core workflows exist, but several are feature-flagged, partially integrated, or dependent on operational setup such as storage buckets, social OAuth, Sheets, AI keys, and payment providers.

CONTRADICTION: Some documentation and route names still describe a freelancer marketplace, while newer app behavior and feature flags describe an internal creative calendar and request system.

2. Product Vision

- **VERIFIED:** Newer code and feature flags indicate a managed creative operating system for Indian businesses.
- **VERIFIED:** Legacy modules indicate an ambition to support freelancer marketplace, negotiation, escrow, and broader SaaS tooling.
- **INFERRED:** The product is meant to become a system of record for creative work: briefs, files, messages, approvals, publishing, AI output, and performance data.
- **UNKNOWN:** Whether public positioning should emphasize agency service, SaaS workspace, AI platform, marketplace, or a hybrid.
- **CONTRADICTION:** The product name and brand system alternate between Mint More and CREATYV depending on area and implementation age.

3. Business Model

- **VERIFIED:** Backend contains membership, access pass, wallet, Mint Credit, MintCoin, storage add-on, Razorpay, escrow, commission, margin, and pricing configuration logic.
- **VERIFIED:** Client UI currently hides payment/wallet surfaces when wallet feature flags are off.
- **VERIFIED:** Calendar selections consume MintCoins and custom requests may be reviewed with an assigned MintCoin cost.
- **INFERRED:** Phase 1 business model uses MintCoins as a client-facing monthly creative entitlement while keeping cash wallet/payment plumbing available for later.

- UNKNOWN: Final price packaging, renewal terms, legal treatment of MintCoins, refund rules, and whether pilot clients pay subscription, service fee, or manual invoice.

4. Target Users

User Type	Evidence	Current Role in Product
Client / Business	VERIFIED	Creates calendar picks, custom requests, files, messages, AI generations, social connections, and support tickets.
Admin	VERIFIED	Controls users, feature flags, calendar events, ops tasks, approvals, commercial settings, audit records, AI settings, and support.
Designer / Staff	VERIFIED	Receives assigned internal creative tasks and can upload deliverables to client project spaces.
Freelancer	VERIFIED	Exists as a legacy/future role with profile, matching, negotiation, wallet, and marketplace surfaces.
Public visitor	VERIFIED	Views landing page and public Mint AI Q&A assistant.
Operations manager	INFERRED	Likely represented by admin permissions rather than a distinct role in all places.

5. Roles & Permissions

VERIFIED: Detected roles include client, freelancer, admin, and designer. Admin capabilities are permission-scoped in several backend routes/services.

Role	Core Capabilities	Restrictions / Unknowns
client	Calendar picks, custom requests, Mintbox, messages, support, social, AI, settings.	Cannot access admin or designer areas. Payment and marketplace visibility depends on flags.
designer	Assigned tasks, task status updates, delivery upload, message participation.	Verification requirements appear partially inconsistent with internal staff expectations.
admin	User management, approvals, feature flags, commercial controls, ops, calendar, audit, support.	Capabilities depend on scoped permissions; some naming differs between modules.
freelancer	Profile, matching, jobs, negotiation, wallet, portfolio in older/future flow.	Generally hidden in Phase 1 when freelancer flags are off.

CONTRADICTION: Permissions include both ops.manage and operations.manage patterns in different areas, creating potential inconsistency in access checks.

6. Complete Feature Inventory

Category	Feature	Status
Client workspace	Dashboard, calendar, requests, Mintbox, insights, messages, support, settings	VERIFIED / launch-facing
Creative calendar	Admin events, client selections, MintCoin reservations, pending review	VERIFIED / launch-facing
Custom requests	Internal request intake, admin review, production task creation	VERIFIED / launch-facing
Internal ops	Task assignment, designer status, slots, CSV/Sheets sync hooks	VERIFIED / partially integrated
Mintbox	Project folders, files, share links, previews, delete flows	VERIFIED / partially complete
Chat/messages	Project-based conversations and delivery artifacts	VERIFIED / partially complete
Social	Facebook/Instagram/YouTube connection, posting, analytics surfaces	VERIFIED / partially complete
Mint AI	Authenticated generation and public Q&A assistant	VERIFIED / partially complete
Admin	Users, designers, flags, calendar, approvals, audit, pricing, settings	VERIFIED
Marketplace	Freelancer matching, negotiation, wallet, escrow, browsing	VERIFIED / hidden future feature
Payments	Razorpay, wallet, membership, passes, ledger, add-ons	VERIFIED / hidden or mockable
WhatsApp	Roadmap/architecture mentions	INFERRED / future

7. Navigation Audit

- VERIFIED: Client navigation exposes Dashboard, Calendar, Inbox, Requests, Mintbox, Insights, Messages, Support, and Settings depending on flags.
- VERIFIED: Admin navigation exposes overview, inbox, users, approvals/ops, wallet/commercial controls, Mint AI, audit records, settings, and feature flags depending on implementation state.
- VERIFIED: Designer navigation exists for internal work handling.
- CONTRADICTION: Several routes still use jobs internally while labels now say Requests or Custom Designs.
- UNKNOWN: Final navigation priority for pilot clients, especially whether Inbox and Messages should both exist.

8. Information Architecture

VERIFIED: Major objects include users, profiles, KYC records, admin permissions, feature flags, platform settings, calendar events, calendar selections, creative requests/jobs, production tasks, designers, MintCoin lots/transactions, wallet

transactions, Mintbox folders/files/share links, chat threads/messages, notifications, social accounts/posts/media/insights, AI models/generations, support tickets, audit logs, memberships, passes, add-ons, and payment records.

INFERRED: The central relationship is Client -> Creative Event or Custom Request -> Production Task -> Designer -> Mintbox Folder -> Files -> Messages/Notifications -> Optional Social Publishing.

UNKNOWN: Final data ownership rules for deleting client files, projects, account resets, and archived work are not fully settled.

9. Complete User Workflows

Authentication

Start and steps: User signs up or logs in; role determines redirect and navigation; profile and entitlements are fetched.

Failure / unknown states: 401/token expiry, role mismatch, missing profile, disabled feature.

Client calendar selection

Start and steps: Client opens calendar, selects event creatives, confirms selection; backend reserves coins or marks pending review; production task may be created.

Failure / unknown states: Duplicate events, insufficient coins, admin review pending, duplicate task prevention.

Custom request

Start and steps: Client submits request with allowed attachments; request enters ops review; admin approves/rejects and assigns cost/priority; task is created for internal ops.

Failure / unknown states: Unsupported file types, missing KYC/entitlement depending flags, duplicate approval states.

Ops task assignment

Start and steps: Admin views task queue, assigns designer and slot, updates status, may sync/export CSV or Sheets.

Failure / unknown states: No designer, slot not set, Sheets credentials missing, stale task status.

Designer delivery

Start and steps: Designer sees assigned task, communicates, uploads deliverable to Mintbox, changes status to delivered/revision/completed.

Failure / unknown states: Upload failure, missing notification, wrong folder, preview restrictions.

Messages

Start and steps: Project-related chats attach communication and delivery artifacts to a project context.

Failure / unknown states: Unpaired chat, missing project thread, stale recipients.

Social publishing

Start and steps: Client connects accounts, composes/schedules/publishes to connected platforms, analytics are fetched/displayed.

Failure / unknown states: OAuth denial, expired token, unsupported media, platform-specific publishing errors.

Mint AI

Start and steps: User submits generation request; backend creates generation and worker processes it via configured provider/model; output is shown and may be reused.

Failure / unknown states: Quota, invalid model, provider response mismatch, no media context.

Payments

Start and steps: Checkout and wallet/escrow paths exist but can be mocked or hidden during Phase 1.

Failure / unknown states: Missing Razorpay keys, idempotency, hidden UI but active backend paths.

10. Business Rules

- VERIFIED: Feature flags control visibility of calendar, internal ops, custom requests, Mintbox, chat, social insights, Mint AI, wallet UI, marketplace, freelancer portal, matching, and negotiation.
- VERIFIED: Calendar events have costs and duplicate-prevention logic exists for batch additions.
- VERIFIED: Unsupported file extensions should be rejected during upload validation.
- VERIFIED: One active production task per source is intended for custom request/calendar approval flows.
- VERIFIED: Designer task statuses include assigned, in_progress, delivered, revision, blocked, and completed.
- VERIFIED: Admin reset/kill-switch style operations require high-scope admin permission.
- INFERRED: Client-facing wallet/payment flows are intentionally hidden during Phase 1.
- UNKNOWN: Final policies for cancellation, client deletion, designer deletion, and public link revocation need stakeholder confirmation.

11. Dashboard Analysis

Dashboard	Purpose	Primary Actions
Client	Calendar-first creative operations overview.	Open calendar, create request, view in-progress/delivered work, check setup, see insights.
Admin	Platform and operations command center.	Manage users, flags, calendar, requests, tasks, designers, audit, pricing/settings.
Designer	Personal task queue for internal fulfillment.	Accept/update assigned work, upload deliverables, message client/admin.
Freelancer	Legacy/future marketplace work dashboard.	View matches, negotiate, upload work, wallet.

UNKNOWN: Exact KPI priority for the client dashboard remains unresolved: calendar progress, content delivery, insights, AI, or storage could each be primary depending on strategy.

12. AI Analysis

- VERIFIED: Authenticated Mint AI generation exists with model/provider configuration and generation records.
- VERIFIED: Landing page has a public Q&A assistant with guardrails and contact information.
- VERIFIED: Admin settings appear intended to control Q&A context, contact details, model choices, quotas, and tool behavior.
- INFERRED: AI is both a marketing assistant and internal product help layer.
- UNKNOWN: Final model routing, media understanding, cost controls, moderation, prompt injection handling, and production quotas.

13. Notification System

- VERIFIED: Notifications and unread counts exist and are fetched by frontend clients.
- VERIFIED: SSE/live update infrastructure exists for at least some events.
- VERIFIED: Task/custom request/calendar actions are intended to notify admins, clients, and designers.
- UNKNOWN: Complete notification coverage is not proven for all custom request approval, designer delivery, admin review, support, and chat events.
- RISK: Missing notifications can break operational trust because Phase 1 depends on human team handoff.

14. File & Storage System

- VERIFIED: Supabase Storage is used for Mintbox and avatars.
- VERIFIED: Mintbox has project folders, file records, share routes, deletion routes, and preview/download behavior.
- VERIFIED: File type validation exists or is intended for project/request upload flows.
- VERIFIED: Public app URLs are intended to hide direct storage-provider URLs.
- UNKNOWN: Malware scanning, file retention, storage quotas, access revocation, thumbnail generation, and long-term AWS S3 migration timing.

15. Payment & Billing

- VERIFIED: Payment, wallet, membership, access pass, credit, add-on, ledger, escrow, and commission modules exist.
- VERIFIED: Razorpay checkout can be disabled or mocked for testing depending on environment/config.
- VERIFIED: Phase 1 hides wallet UI from clients when flags are off.
- CONTRADICTION: Some product planning expects wallet-first payments, while current pilot flow hides wallet and uses MintCoins as the primary client-facing unit.
- UNKNOWN: GST, invoices, refunds, legal treatment of credits, and pilot pricing require legal/finance confirmation.

16. Settings

- VERIFIED: Platform settings contain commercial controls, feature flags, AI settings, Q&A assistant settings, storage/add-ons, social benchmarks, membership/trial settings, margins, commissions, revisions, and payout rules.
- VERIFIED: Some values are admin-editable while others still appear as defaults or code/config constants.
- UNKNOWN: Which settings are safe for non-technical admins to edit directly versus requiring controlled form fields and validation.

17. Feature Flags

Flag	Likely Phase 1 State	Purpose
calendar_creatives	on	Client monthly creative calendar.
internal_ops	on	Route work to Mint More team/designers.
custom_requests	on	Allow client custom design intake.
mintbox	on	Project file system.
chat	on	Project messages.
social_insights	on	Social connection and analytics surfaces.
mint_ai	on	AI content and assistant features.
wallet_ui	off for clients	Hide cash wallet/payment UI during Phase 1.
marketplace	off	Hide public freelancer marketplace.
freelancer_portal	off	Hide freelancer-facing launch surface.
freelancer_matching	off	Prevent automatic freelancer matching.
negotiation	off	Hide freelancer/client negotiation.

18. Technical Constraints

- VERIFIED: Architecture uses React/Vite frontend, Node/Express backend, Postgres/Supabase, Supabase Storage, Redis/BullMQ/SSE in selected areas, Razorpay, OpenRouter, Meta/Facebook, YouTube, and Google Sheets integrations.
- VERIFIED: Local and production environment differences can materially affect behavior.
- INFERRED: Operational reliability depends on correctly configured storage buckets, service keys, social app credentials, AI keys, queue workers, and Sheets service account access.
- RISK: Broad feature surface increases regression risk unless feature-flag and role test coverage is strong.

19. UX Assumptions Detected

- Assumes clients understand calendar-based creative planning.
- Assumes MintCoins are understandable without payment language.
- Assumes internal ops can review over-credit and custom requests quickly.
- Assumes designers understand task priority from assignment, slot, due date, and status.
- Assumes project files, messages, and deliverables should live together.
- Assumes clients need social insights but may not understand platform analytics deeply.
- Assumes public users can self-serve basic answers through Mint AI Q&A.
- Assumes legacy marketplace modules can remain safely hidden behind flags.
- Assumes mobile use matters for clients, while admin/designer mobile readiness is still catching up.

20. Product Risks

Risk Type	Risk	Why It Matters
UX	Clients may not understand MintCoins, calendar selection, request status, or where messages/files live.	Confusion increases support load and reduces trust.
Technical	Storage, social OAuth, AI models, and worker queues depend on external configuration.	Misconfigured envs can break core workflows.

Business Operational	Marketplace and internal agency positioning may conflict. Internal fulfillment needs reliable task assignment, notifications, and Sheets/export workflows.	Messaging confusion can reduce conversion. Missed handoffs directly affect delivery.
Security	Uploads, public share links, reset tools, and AI inputs require strict validation and access control.	Weak controls can expose data or create abuse paths.
Financial	Hidden wallet/payment features may still be active in backend.	Payment logic must be idempotent and auditable before production money.

21. Missing Product Knowledge

ID	Priority	Category	Question	Why Required	Design Decisions Depending On It	Owner	Status	Confidence	Evidence
Q1	Critical	Vision	Is Phase 1 strictly internal fulfillment, or should clients see freelancer marketplace options?	Sets product promise.	Navigation, requests, status language, marketplace visibility.	Founder / Product Owner	Contradictory	80%	Flags hide marketplace; legacy docs describe marketplace.
Q2	Critical	Business Model	What is one MintCoin worth operationally and commercially?	Prevents pricing confusion.	Calendar cost labels, request approval, invoices, upsell.	Founder / Finance	Unknown	35%	Coins exist; money mapping not finalized.
Q3	Critical	Operations	What SLA should clients expect for calendar creatives and custom requests?	Defines trust and status expectations.	Due dates, reminders, overdue states, dashboard copy.	Operations	Unknown	25%	Statuses exist but policy unclear.
Q4	High	Operations	How should over-credit selections be approved, rejected, or billed?	Controls edge cases.	Review queue, client messaging, admin actions.	Operations / Finance	Inferred	60%	Pending review state exists.
Q5	High	Operations	Who assigns designers: admin, ops lead, or automatic rules?	Defines ownership.	Task queue, assignment UI, notifications.	Operations	Unknown	40%	Assignment exists; policy unclear.
Q6	High	Roles	Are designers employees, contractors, or future freelancers?	Affects verification and permissions.	Designer onboarding, KYC, task visibility, payment.	Founder / Operations	Contradictory	65%	Designer role exists; verification banner appeared.
Q7	Critical	Payments	Are payments disabled, mocked, or manually invoiced during pilot?	Prevents broken checkout.	Billing UI, wallet hiding, admin controls.	Founder / Finance / Developer	Inferred	70%	Wallet UI hidden; Razorpay not configured.
Q8	High	Legal	Who owns final creative files and how long are they retained?	Needed for trust and deletion.	Mintbox delete/archive, public links, terms.	Founder / Legal	Unknown	20%	Storage exists; retention unknown.
Q9	High	Social	Which platforms are promised at launch?	Avoids broken expectations.	Connect UI, publish UI, landing claims.	Marketing / Developer	Inferred	55%	FB/IG/YT paths exist.
Q10	Medium	AI	Which AI tools are launch-ready versus experimental?	Prevents overpromising.	Tool menu, model choices, quotas, warnings.	Product Owner / Developer	Unknown	35%	AI routes exist; model issues observed historically.
Q11	High	Support	What is the support SLA and escalation path?	Client confidence.	Support ticket states, notifications, dashboard.	Operations / Support	Unknown	25%	Support feature exists.
Q12	High	Notifications	Which events must notify client, designer, and admin?	Core handoff reliability.	Notification center, SSE, email/WhatsApp later.	Operations / Product	Unknown	45%	Some notifications exist; coverage uncertain.
Q13	Critical	Security	What file types and max sizes are allowed per workflow?	Protects platform.	Uploader restrictions, previews, errors.	Developer / Security	Inferred	70%	Validation exists but user found gaps.
Q14	Critical	Admin Safety	What data must be preserved when using a reset/kill switch?	Avoids accidental loss.	Reset UI, confirmations, backups.	Founder / Developer	Unknown	30%	Kill switch requested/implemented conceptually.
Q15	High	Users	How technical are pilot clients?	Sets onboarding depth.	Language, guided setup, empty states.	Sales / Marketing	Unknown	20%	SMB target inferred.
Q16	Medium	Calendar	Who curates monthly event opportunities and by what date?	Defines calendar ops.	Admin event tools, batch import, duplicates.	Marketing / Operations	Inferred	55%	Admin batch and duplicate logic exist.
Q17	High	Scope	What qualifies as a custom request versus calendar creative?	Prevents unlimited work.	Request form, coin costing, approvals.	Operations / Product	Unknown	35%	Custom request flow exists.
Q18	Medium	Roadmap	When should	Controls future IA.	Feature flags, nav,	Founder /	Unknown	30%	Hidden modules exist.

			freelancer features be exposed?		onboarding.	Product			
Q19	High	KYC	Is client verification required in Phase 1 before requests?	Affects activation friction.	Verification prompts, post request blocks.	Founder / OpsContradictory / Legal	55%		KYC blocks older paid orders; Phase 1 may not need it.
Q20	Medium	Analytics	Which social metrics matter to SMB clients?	Avoids noisy dashboards.	Insights hierarchy, labels, benchmarks.	Marketing / Customer	Unknown	25%	Insights exists; metric strategy unclear.
Q21	High	AI Safety	What may public Q&A promise or refuse?	Protects brand/legal.	Q&A prompt, admin settings, contact fallback.	Founder / Marketing / Legal	Inferred	60%	Guardrails and contact settings exist.
Q22	Medium	Mobile	Which roles must fully operate on mobile?	Responsive priority.	Admin/designer/client mobile UX.	Product Owner	Unknown	35%	Mobile requests recurring; no policy.
Q23	High	Audit	Which actions require immutable audit records?	Compliance and support.	Audit filters, event metadata, admin logs.	Operations / Developer	Inferred	55%	Audit exists; coverage unknown.
Q24	Medium	Retention	What recurring habit should the product create?	Defines dashboard and reminders.	Calendar nudges, weekly summaries, insights.	Founder / Product	Unknown	30%	Calendar-first strategy inferred.
Q25	Critical	Brand	Should users primarily see Mint More, CREATYV, or both?	Identity clarity.	Landing, app shell, emails, legal names.	Founder / Marketing	Contradictory	75%	Both names appear.

22. Contradictions

- Product identity: CREATYV is now prominent, but Mint More remains in branding, API concepts, and documentation.
- Fulfillment model: Phase 1 routes work internally, while older marketplace code routes jobs to freelancers and negotiation.
- Payment model: client wallet and escrow exist, but Phase 1 hides payment surfaces and emphasizes MintCoins.
- Role model: designer appears as internal staff but may still be affected by verification/KYC assumptions from paid-work flows.
- Permissions: ops/manage naming differs across modules.
- Information architecture: jobs, requests, custom designs, calendar picks, and tasks overlap in naming and data paths.
- Documentation freshness: older READMEs and implementation docs describe product states that are not necessarily the current launch plan.

23. Final Summary

Known: The codebase supports a client creative calendar, custom design requests, Mintbox file storage, internal task assignment, designer workflows, messages, social publishing/insights, Mint AI, notifications, admin controls, feature flags, and hidden future marketplace/payment capabilities.

Assumed or inferred: The intended 7-day launch is a managed internal creative operations pilot for Indian businesses, with freelancer marketplace and wallet-heavy workflows hidden from clients.

Unknown: Commercial packaging, MintCoin value, client SLAs, operational ownership, legal/payment rules, exact notification coverage, mobile role priority, file retention, and final brand architecture.

Before any major redesign begins, the team must answer: what the product is promising in Phase 1, what users must understand in the first session, which workflows are launch-critical, what will be hidden, what operations can reliably fulfill, and which business rules are non-negotiable.
